Basic Care for Your New Lawn

Seed. sod and hydroseeding require immediate and long-term care for proper establishment and maintained health.

What to Expect:

2-4 weeks: Seed germination
4-6 weeks: Seed establishment
1 year+: Lawn maturity reached (with proper up-keep)

>>

Watering & Ongoing Maintenance

- Water lawn deeply for the first growing season.
- Water during the early morning or early evening for optimal absorption.
- Don't let the soil get too dry or too wet, let the soil dry slightly between waterings.
- Weeds are common in new lawns grown in the spring.
- Fertilizing in the early spring and fall can help maintain or improve the health of your lawn.
- Aerating compact soil in the spring helps improve nutrient, water and oxygen uptake by turf.
- Overseeding in the fall helps build a thicker lawn and smother out unwanted weeds.
- Contact Atlantic Lawn & Garden to learn about our turf care program.
